

PROJECT: Implement Client Script & UI Policy – Incident

3. Project Design Phase

Design Approach

The Incident form is the main interface. UI Policies handle declarative field behaviour, while Client Scripts handle client-side logic and validation.

UI Policy Design

Create a UI Policy for the Incident table, define its condition, and configure actions such as Mandatory, Visible, and Read-only.

Client Script Design

Use onLoad for form-load behaviour, onChange for field-change behaviour, and onSubmit for validation before form submission.

Process Flow

User opens or changes an Incident field → condition is evaluated → UI Policy changes field properties and/or Client Script performs validation → user receives feedback.

Deliverable

A detailed design of the Incident form behaviour and configuration.
